

For Hyperpigmentation:

GLUTANG

(Glutathione inj. 600 mg)

Recommended Dosage: 600-1200 mg once/twice in a week

An endogenous peptide, protects against oxidative stress¹

Reduced form, GSH, seems to be instrumental in the depigmenting properties of this unique molecule²

As a skin lightening agent, glutathione inhibits tyrosinase enzyme which helps in synthesis of melanin²

Modifies the production of eumelanin to pheomelanin; leads to lightening of skin²

The Super Anti-oxidant

Regulate Immune System with:

NGVITA

(Ascorbic Acid 1.5gm Injection)

Study Objective¹: To evaluate the effectiveness of intradermal injection of a combination of Tranexamic acid (TA) with ascorbic acid on one side of the face and to compare it with the intradermal injection of TA plus placebo on the opposite side in the treatment of melasma.

Study Type: Prospective, double-blind, split-face, randomized controlled clinical trial.

Results: Intracutaneous injection of a combination of TA with ascorbic acid could significantly reduce the patients' MASI scores from the eighth week onward compared with the pre-intervention condition.

Comparison of the effectiveness of the intervention according to the Melasma Area and Severity Index (MASI) score in groups A (tranexamic acid plus normal saline) and B (tranexamic acid plus ascorbic acid)

Timeline	Group (N = 24)	Mean ± SD	p value
Baseline	A	4.49 ± 1.48	0.30
	B	4.61 ± 1.54	
4th week	A	4.29 ± 1.44	0.63
	B	4.34 ± 1.51	
8th week	A	3.66 ± 1.35	<0.001
	B	2.40 ± 1.25	
12th week	A	2.82 ± 1.29	<0.001
	B	2.40 ± 1.25	
24th week	A	3.20 ± 1.21	<0.001
	B	2.61 ± 1.14	

Note: Bold p values are statistically significant at 0.05%.

Abbreviation: SD, standard deviation.
